
WORKSHOP DESCRIPTION

INTRODUCTION TO WEB SCRAPING

'Web scraping' is an umbrella term for (mostly) automated techniques for collecting information from the web. Working with web scraping involves both the collection of raw data from the web as well as handling and converting these data to a manageable and analyzable format.

At the workshop you will be introduced to the basic concepts of web scraping, including how to engage with the web as a researcher as well as a hands-on introduction to web scraping in Python.

There will be hands-on examples in Python but even without prior experiences with Python, you should be able to follow along.
